

Here we present our communication with the official team when reporting an inconsistency. To preserve anonymity, we do not provide the original link and instead present excerpts of the discussion. The reported issue is that wx:if throws an error under GW configuration, corresponding to C1 in Table 1, which is also described in the case study.

#1 [redacted] opened on Oct 22, 2024 MiniDiff Author

Here we describe how this issue behaves across different platforms.

在Android和Windows平台上setData后wxs函数会响应两次，wx:if判断条件会受这个影响，当前后两次判断结果不同时会出现，界面会卡住。

On Android and Windows platforms, after setData, the wxs function will respond twice. The wx:if condition is affected by this. If the results of the current and later two checks differ, an error will occur and the interface will freeze.

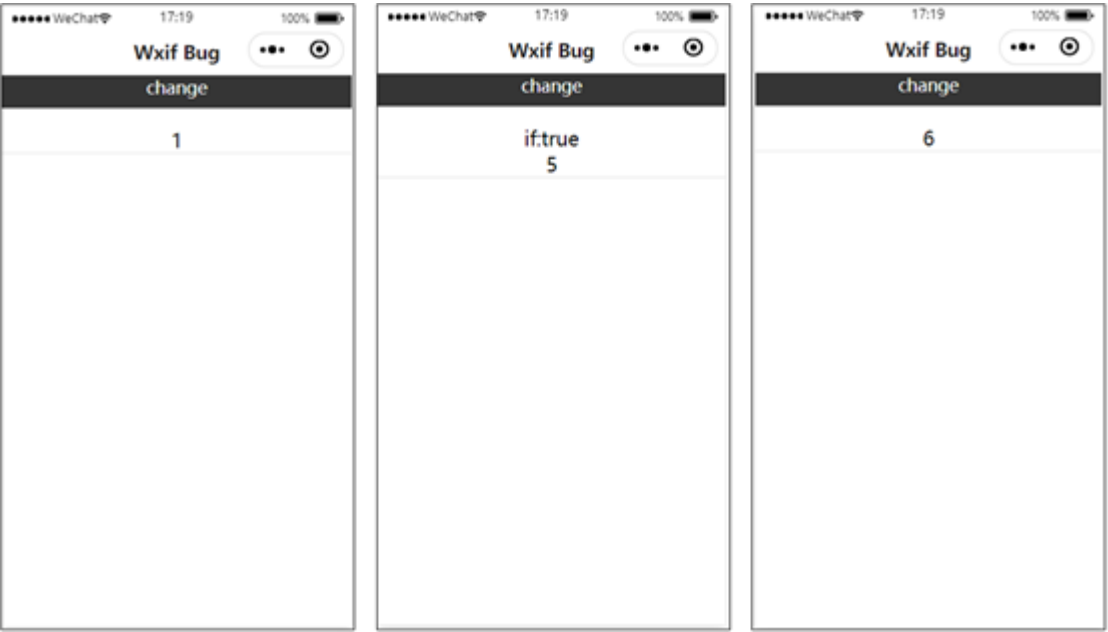

写了一个用wx:if进行条件渲染的片段。一个按钮点击计数，计数达到5之后显示一个view。在开发工具上点击五次后会正常出现view再点消失。在Android上点两次后会卡住，view不出现，再点没反应。Windows上点一次就会卡住。

wrote a clip for conditional rendering using wx:if. Click the count button once; when the count reaches 5, a view is displayed. After clicking five times in the development tools, the view will appear normally, then click disappear. On Android, after clicking twice, it freezes, the view doesn't appear, and clicking again has no response. On Windows, it freezes after just one click.

开发工具上情况: development tool situation:

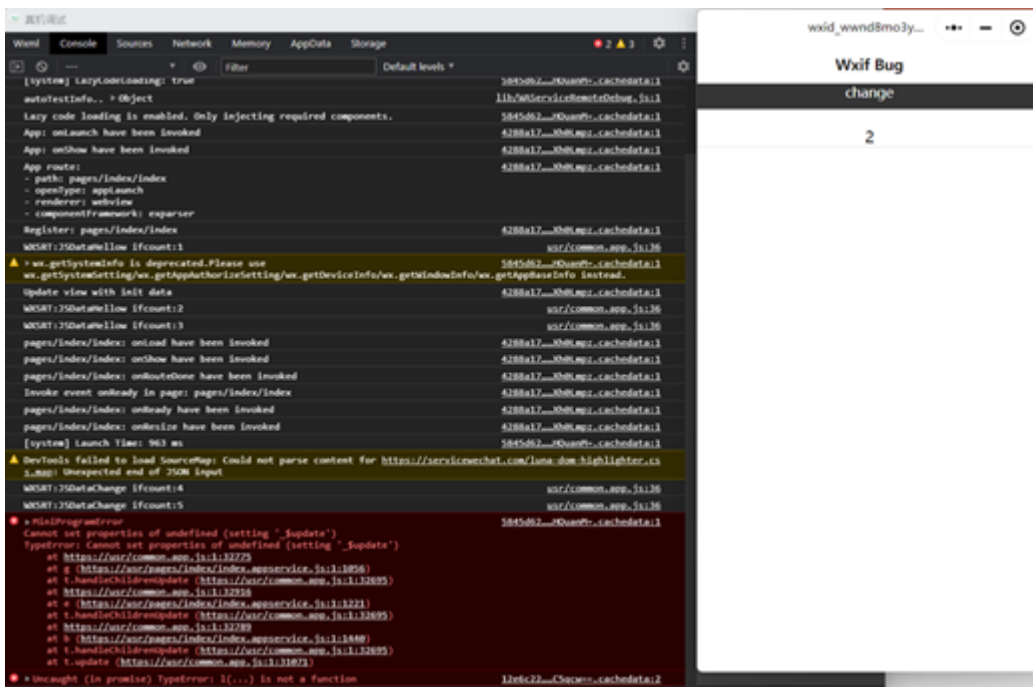

Android上的情况，下为调试log，点两次后报错卡住，后续点击有log但界面不变：

On Android, below is the debug log. After clicking twice, it gets stuck and errors. Later, when you click the log, the interface remains unchanged:

Windows上的情况，左为调试log，点击一次就会报错卡住，后续点击有log但界面不变：

On Windows, the left is the debugging log. Clicking once causes an error and freezing; subsequent clicks show the log but the interface remains unchanged:

The maintainer explains that the execution frequency of WXS functions is related to the template update mechanism, and that the timing of template updates in glass-easel is unstable, which may lead to cases where functions are not executed.

关于为什么会不同，请参考 [#203](#)。

For reasons why it is different, please refer to [#203](#).

首先，在实践中不应该用上述实现方式，因为 WXS 函数执行与模板更新有关，而模板何时被更新是很难控制的。或者说，WXS 函数的返回值应只取决于它的参数。

First, in practice, the above implementation should not be used, because WXS function execution is related to template updates, and it is difficult to control when templates are updated. In other words, the return value of the WXS function should depend only on its parameters.

在 glass-easel 上这个问题更加明显。出于性能考虑，在执行 setData 时，glass-easel 有时甚至会跳过部分模板片段！这就是为什么 `MT.ShowIfCount` 有时不被执行。

This issue is even more pronounced on Glass-Esl. For performance reasons, when executing setData, glass-easel sometimes even skips some template fragments! That's why `MT.ShowIfCount` sometimes aren't executed.

LastLeaf mentioned this [on Oct 22, 2024](#)

[Android和Windows上界面初始化次数不一样 #206](#)

We correct the execution behavior: the issue is not missing execution, but an extra execution.

其实不是`MT.ShowIfCount`不被执行，而是每次点击在Android和Windows都上被执行了两次，但界面只显示第一次的值。因为使用的是全局变量，前后两次返回值不同，当判断结果不同且view是从无到现实就报错，界面卡住，再点击没反应。

Actually, it's not that `MT.ShowIfCount` isn't executed, but that every click is executed twice on both Android and Windows, but the interface only shows the value of the first time. Because global variables are used, the return values differ twice. When the judgment results differ and the view goes from nothing to reality, an error occurs, the interface freezes, and clicking again does nothing.

The maintainer has successfully reproduced the isuess: IfCount has executed, but due to a non -glass-easel rendering bug, the content is not displayed correctly.

我试了一下代码片段，在 android 上 IfCount 是被执行了的（有 wxs 里面的日志），但是 =5 的时候遇到了一个 bug 导致没显示出来。

I tried some code snippets, and on Android, IfCount is executed (with logs from wxs), but at =5, a bug occurred causing it not to display.

（这个 bug 不是 glass-easel 的 bug 所以无法用本项目独立复现。）

(This bug is not a glass-easel bug, so it cannot be independently reproduced in this project.)

The root cause is explained: Due to the influence of shadow data, WXS functions in non-dev environments may execute an extra time.

目前在启用 glass-easel 但未启用 skyline 的时候，在非开发者工具环境下，WXS 函数可能会多运行一次。
Currently, when glass-easel is enabled but skyline is not, the WXS function may run once more in a non-developer tool environment.

Finally, the issue is confirmed as a Mini Program bug and has been handed to the relevant team for fixing

已确认这个 bug 不是 glass-easel 的 bug 而是小程序环境上的 bug，已经提给那边等待修复了。
It has been confirmed that this bug is not a glass-easel bug but a bug in the mini program environment, and it has been reported over there for fixing.

After three mounths, we retested the issue on the base library version v3.7.6. The error had disappeared, but the execution logic issue remained: after clicking, the WXS function inside wx:if was still executed twice, but only the later value was used, so no conflict occurred.
